3. The application has been amended as follow:

In the claims:

4. Claims 9 & 21 are amended as following:

II. AMENDMENTS TO THE CLAIMS

The following listing of claims replaces all prior versions, and listings, of claims in the application:

- 1-8. (Canceled).
9. (Currently Amended) A method for providing a status of a transaction with an application on a server, comprising:
 - receiving a HTTP request for a transaction on the server from a browser on a client;

invoking the application on the server to process the HTTP request;
calling a client code generator to generate a first polling code having a first Uniform Resource Locator (URL) that includes a first set of parameters, wherein the first set of parameters comprises a delay time and a polling count;

sending the first polling code to the browser;
communicating the first URL in the first polling code from file browser to a server agent on the server after expiration of the delay time to request file status of file transaction;

generating a second polling code having a second Uniform Resource Locator (URL) that identifies a second set of parameters and the transaction requested if the transaction is incomplete and the polling count does not equal a polling count limit, wherein the second set of parameters comprises the delay time and a new polling count;

sending the second polling code to the browser; and
communicating the second URL in the second polling code from the browser to the server after expiration of the delay time to request the status of the transaction.

10. (Original) The method of claim 9, wherein the first URL is processed by the sex-vet agent on the server to determine the status of the transaction.

11. (Original) The method of claim 9, further comprising directing the browser to a completion page if the transaction is complete.

12. (Original) The method of claim 9, further comprising directing the browser to an exception page if the transaction is incomplete and the polling count equals a polling count limit.

13-20. (Canceled).

21. (Currently Amended) A program product stored on a recordable storage unit

computer readable storage medium for providing a status of a transaction with an application on a server, which when executed, comprises:

agent program code configured to receive a HTTP request for the transaction from a browser on a client, and to initiate the transaction based on the request;

generator program code invoked by the agent program code configured to generate a first polling code having a first Uniform Resource Locator (URL) that includes a first set of parameters, wherein the first set of parameters includes a delay time and a polling count, and to send the first polling code to the client, wherein the client communicates the first URL in the first polling code to the agent program code after expiration of the delay time to request the status of the transaction;

wherein the agent program code is further configured to process the first URL to determine the status of the transaction, and to invoke the generator program code to generate a second polling code having a second URL that identifies a second set of parameters and the transaction requested if the transaction is incomplete and the polling count does not equal a polling count limit, send the second polling code to the browser and communicate the second URL in the second polling code from the browser to the server after expiration of the delay time to request the status of the transaction, wherein the second set of parameters comprises the delay time and a new polling count.

22. (Canceled).

23. (Currently Amended) The program product of claim [[22]] 21, wherein the client comprises a browser configured to receive the first polling code, and to communicate

the first URL to the agent program code after expiration of the delay time.

24. (Canceled).

25. (Currently Amended) The program product of claim 21, ~~wherein the second set of parameters comprises the delay time and a new polling count, and wherein the generator program code increments the polling count of the first set of parameters by one to yield the new polling count.~~

REASONS FOR ALLOWANCE

5. Claims 9-12, 21, 23 & 25 are allowed.
6. Claims 1-8, 13-20, 22 & 24 are canceled.
7. The following is an examiner's statement of reasons for allowance:

In interpreting the claims, in light of the specification and the applicant's arguments filed on 1/4/08, the Examiner finds the claimed invention to be patentably distinct from the prior art of record.

1. Donker et al. (US 2004/0107267 A1), teach system and method for determining the availability of a website wherein receiving, invoking and requesting the status of the transaction (abstract; figure 1 & 3; page 1, paragraph 16; page 4, paragraph 52; page 7, paragraph 69; page 4, paragraph 49 & 53).
8. Gentry et al. (US 6,434,651 B1), teach method and apparatus for suppressing interrupts in a high-speed , wherein generating the polling count and polling count limit (abstract; figure 2, 4, & 7; col 9, lines 40-45).

9. The following is an examiner's statement of reasons for allowance.

The examiner has found that the prior art of record does not appear to teach or suggest or render obvious the claimed limitations in combination with the specific added limitations as recited in independent claims 9 & 21 and subsequent dependent claims. The prior art of record fails to teach or suggest individually or in combination that generate a second polling code having a URL that identified a second set of parameters and the transaction requested if the transaction is incomplete and the polling count does not equal to a polling count limit, wherein the second set of parameters comprises the delay time and a new polling count and sending the polling code to the browser and communicated the second URL after expiration of the delay time to request the status of the transaction as set forth in independent claims 9 & 21. Claims 9-12, 21, 23 & 25 are allowed because of the combination of other limitations and the limitation listed above.
